ABSTRACT OF THE DISCLOSURE

The present invention provides a directory server system
5 comprising : a directory server for storing an attribute of an entry ; an entity
monitor being connected to the directory server for monitoring an entity, so
that if a change in a state of the entity appears, then the entity monitor
instructs the directory server to renew an attribute of a corresponding entry
to the entity ; and a directory renewal history storage device being
10 connected to the directory server for storing a renewed attribute of the entry
as attribute renewal history informations.
